Pharmacology Flash Cards Four edition Section I: Vegetative, Autacoid, and Neuromuscular Drugs Title II: Cardiovascular Drugs Title III: Lipid, Coagulation, and Hemathopesi Drugs Section IV: Central Nervous System Oppressive Drugs Section V: Psychotherapeutic Drugs Section VI: Analgesic and Anti-Migrain Drugs Section VII: Neurodegenerative Drugs and Antidotes Section VIII: Anesthesia : Muscoskelton Drugs Section XII: Endocrine DrugsSSecia XIII: Anti-Drugs : Antineoplastic and immunosuppressant drugs © 1996-2014, Amazon.com, Inc. or its affiliates Have you considered the use of flash cards for pharmacology? I certainly agree that pharmacology is one of the most challenging courses in medical school. The amount of information you have to absorb is so generous that studying this course makes it too overwhelming. Provided that huge chunks of knowledge are required, unfortunately, our memory has only limited capacity to digest everything. That's why we need a resource to help us best make pharmacology training fun and bearable. What we need is a flash card for pharmacology! In this post, I'll give you 10 of the best flash cards for pharmacology that will surely enhance your knowledge of essential drugs suitable for your future patients. Why is pharmacology so difficult? This is a question lingering among medical students - Why is pharmacology so difficult? The truth is, for you to survive pharmacology, there are tons of concepts that you have to remember. Either you know it or you don't. Drug classes, mechanisms of action, indications, and contraindications, adverse and therapeutic effects, doses, and more! In addition to memorizing all of this, you should also have good analytical and critical thinking skills. Before choosing the ideal drug, it is necessary to integrate it with the patient's condition and laboratory values. FYI: Want to know more about how to crush Step 1? Check out our free turn-based master class to help you get 250 on step 1! How do you do well in pharmacology? Since you know that the complexity of pharmacology is a real game, you need to set ways on how to conquer. Here are some ways that I could offer: 1. Install an effective learning strategy learning strategy allowing you to learn smart. Yes, there may be tons that you should remember, but having a learning strategy will help you determine what to learn and how to learn. For example, if you are trying to study antibacterial drugs, do not study using a drug-related approach. It's tedious and overwhelming as there are thousands of existing registered drugs in the world. Drugs are not the only concepts that need to be studied for medical school. Save your memory. No need to remember everything effects on the drug. Nausea and vomiting is a common non-specific side effect for essential medications, so you need to consume extra time squeezing them into your memory. Focus on what is more important and specific. 2. Organize drug classes again, studying each drug is ineffective. Use the class foundation to class. Thus, you will focus only on one mechanism of action, indications, adverse effects, drug interactions on a set of drugs. As much as possible, avoid learning tons of information at once. This will cause burnout and stress, leading to counterproductiveness and a decrease in your ability to remember. 3. Focus on the mechanism of action it is essential to know how drugs affect the body. Is your heart rate increasing or decreasing? Does it reduce blood pressure? Knowing how the drug works in the body to cause its therapeutic effect will give you a deeper understanding and a clearer idea of which drug to prescribe in the future. 4. Integrating concepts to try to integrate pharmacological knowledge with other medical concepts. This will help you remember, or better improve your critical thinking ability. 5. Use the visual representation of humans to differ from each other in the way they learn. Some may find visual representation the most effective. To study pharmacology, I think using visual representation through flowcharts, graphics, tables and infographics makes the learning process more understandable and interesting because they provide a more specific picture of what is going on inside the body. FYI: Exploring Step 1 with review materials such as the pharmacology of the flash card is great, you also need the right guide to accompany you through the process. The pharmacology of Memory tricks pharmacology, in nature, is difficult, and no one could change that. Fortunately, you can outsmart pharmacology with some memory tricks. Here are some pharmacology memory tricks you can use: 1. Mnemonics Mnemonics are a sample of ideas and letters designed to help memory remember. Remember how you remember 12 pairs of cranial nerves? Oh Oh To Touch And Feel Very Green Vegetables A H This corresponds to olfactory, optical, oculomotor, trochlear, trigeminal, Abduchen, facial, vesbulokchlear, glossopharyngal, Vagus, acoustic and hypoglossal nerve. 2. Create a Palace of Memory This is a method of memory in which you associate pharmacological concepts with places you are familiar with or have strong memories you have had previous encounters before. Check out my post on memory palace here. 3. Chunking Information Chunking is grouping larger pieces of information into smaller, more memorable pieces. You may have used this before when you're trying to remember your phone number. Instead of thinking 777123654, you prefer to divide it into 3, which will result in 777 123 654. With chunking, you tend to group items, find patterns, and organize them according to how you remember them. 4. Write it down, don't enter it out It's time to get traditional. Injure your computer or laptop and take a pen and paper. Whatever you do by hand, it causes the brain to more attention to what you do. When writing, the brain is more active than the type. Take your laptop. You are more likely to remember the notes you write by hand than the ones you type because you are putting in extra effort in the formation of letters. Unlike input, the letters look identical because you only press the input key. 5. Use Flashcards Flashcards to make memorizing fun, challenging and exciting. You can also bring them anytime and anywhere with you so you can learn and train your memory skills as you read them repeatedly. You can try to create your own set of flash cards for pharmacology. The state of the drug class, dosage, mechanism of action, indications, contraindications, and prominent side effects. But if you want to make cards, I suggest following a top 10 flash card for pharmacology for daily use. FYI: Flash cards are fantastic for your step one. However, learning to step one is all in vain if you don't have a step-by-step guide.
